

ARDENTO

BLEEDINGS DISEASE TREES

- Usage** ARDENTO can be used in trees and other woody plants; whenever a less vital soil and a weak resilience may render plants susceptible to abiotic stress. The product supports the natural regenerative capacity and has a nurturing, nourishing and enhancing effect on the plants of which the soil and roots are affected by external causes.
- Composition** ARDENTO is a water-based, highly concentrated mixture made of specific herbal concentrates. ARDENTO is a natural product of vegetable origin. The product is safe for human, animals and environment. Available in liquid form for soil injection or pouring onto the plant.
- Operation** ARDENTO is absorbed by the soil and the roots of the tree. Its root-stimulating and plant-enhancing ingredients will allow the plants to develop an increased resistance and vitality.
- Application** ARDENTO works best if used preventively.
- An optimum effect requires humid conditions. Failing those, irrigation is necessary.
- ARDENTO can be administered through soil injection or pouring onto the plant. The first application should take place when the tree has an active sap flow. Repeat treatment depends on plant, monitoring, infection and population pressure (after 6 to 8 weeks). ARDENTO is always used in combination with the specific fertilizer OMNIFERTIL.

Application and dosage | pouring

Dosage:	Dissolve 1 litre of ARDENTO concentrate in 50 litres of water.
Low dosage:	Use 1 litre of ARDENTO concentrate on 250 m ² of planted surface.
High dosage:	Use 1 litre of ARDENTO concentrate on 100 m ² of planted surface.

Application and dosage | soil injection

Dissolve product:	1 litre of ARDENTO concentrate in 50 litres of water.
Injection:	5 litre solution per hole. Number of holes depends on trunk diameter.
Trunk diameter (cm):	10 - 20 - 30 - 40 - 50 ...
Injection holes (Nr.)	2 - 4 - 6 - 8 - 10 ...
