

# MUCOTER

## Soil fungi in balance for strawberries (Trayfield)

**MUCOTER** can be used where abiotic stress can occur due to a less vital soil, difficult weather conditions and poor plant resilience. Mucoter supports the building up of the natural regenerative capacity and the resilience to this abiotic stress in potatoes. This can indirectly prevent and control the nuisance and damage caused by soil fungi.

**MUCOTER** is absorbed by the plant, the soil and the environment of the roots of the plant. Thanks to the bio-stimulant and plant-strengthening components present, plants and crops will indirectly develop increased resilience and vitality against abiotic stress and show healthy growth and optimal yields.

For optimal performance of Mucoter, humid conditions are ideal.

Mucoter can be dripped and/or used as a foliar spraying.

Administration of Mucoter liquid preferably in the early morning or evening.

Can also be used before or during a light rainstorm and sprinkling.

- Carry out a test spray before use.
- Do not use the product with bright sunlight.
- Pireco cannot be held liable for any damage resulting from improper use.
- Always consult your cultivation advisor for suitable advice and combination applications.
